

Lock out – Good practices

Designation	Description (diagram, photos, etc.)	Functioning
Valves with operating plates		Valves with pad-lockable operating plate, preventing mishandling. Installed on hydraulic systems connected to a single pump that cannot be stopped simultaneously by electrical lockout of the motor linked to the pump. The three-way hydraulic valve cuts off the P of the pump and switches it back to the T of the main tank of the machine. /!\ It still remains to dissipate the energy behind the valve by forced action on the distributor to dissipate the pressure remaining behind the valve /!\.
Schematic on network plan		The valve to be isolated is clearly shown on the network plan.
