1. Generalisation

As soon as a level 3 or 4 emergency situation (Crisis) is triggered, the priority is to protect personnel.

The Crisis management team (CMT) of the Project/site is activated by the Site manager and all personnel place themselves under the orders of the Principal Incident Correspondent (PIC), the Local Incident Correspondent (LIC) or their manager and join their position assigned in the context of an emergency.

2. Role of the Crisis management team

A Crisis management team is a temporary organization, set up by the Project Manager, to tackle a major event on an organised and efficient way.

Its mission is to:

- collect information
- structure information
- analyse information
- enable decision making
- disseminate information
- disseminate decisions

The Crisis management team is sized according to the event and its consequences, both internal to the project and externally (attacks on people and public property, etc.).

Crisis management team members are trained and trained regularly.

3. Composition of the Crisis management team

The main members making up the Crisis management team are:

- a manager (usually the PIC)
- an emergency coordinator
- an events recorder team composed of several members (logbook keeper, telephone operator, etc.)
- technical specialists (mobilised on demand)
- a communication team towards the authorities and the public
- the head of external rescue operations and his deputies

Each member of the Crisis management team has one or more back-ups trained and able to play the role assigned to them.

Depending on the organisation of the site/project, some roles may be merged.

3.1 Crisis management team Manager

The Crisis management team Manager is the Main Incident Correspondent. Depending on the type of Project/site, this role may be assigned to the Project Manager or to one of his direct deputies.

As part of this function:

- has a trained back-up
- must be able to reach the site within a maximum of one hour
- is trained for his duty and his training is regularly refreshed
- has all the information concerning the work in progress and has the capacity to take all necessary measures for the proper conduction of the rescue operations
- ensures the interface between the site and the external emergency management
- ensures effective crisis management, particularly regarding external third-party communication (authorities, media and public)
- is associated with decision-making and engagement of external assistance

3.2 Crisis management team Coordinator

The CMT Coordinator plays a facilitator role at the organizational level of the CMT and more particularly:

- manages the general operation of the CMT
- ensures the necessary material resources are put in place
- instructs the members of the CMT placed under his responsibility

3.3 CMT event record team

The CMT event record team is placed under the responsibility of the Coordinator and:

- records the various events in a logbook, chronologically and factually
- records the actions decided in this same logbook:
 - By whom (person who made the decision - PIC, Rescue Manager, etc.)
 - Who (staff in charge of carrying out the action)
 - What (action type)
 - When (specific time)
 - Where (place where the action takes place)
 - With what (material/equipment used to carry out the action)
- records conversations on Dictaphone or other to ensure the correct transcription of events in the logbook
- takes charge of the PIC telephone so that it remains permanently uninterrupted, particularly in its coordination with the External Rescue Manager
- takes note of the calls in the following form:
 - Who (Last name / First name / Position / Company / Telephone number)
 - When (call time)
 - What (reason for call)
 - Level of interest of the call in relation to the emergency situation
 - Need for a response (yes/no)
- manages calls received on the CMT landline in the same way as previously

- ensures the installation and distribution of the various supports and materials in the CMT room
- manages the provisioning of CMT members (hot and cold drinks, meals)

Depending on the organization of the Project/site, the CMT Secretariat team will be sized by the PIC and the above roles distributed by the PIC to the members of the Secretariat.

3.4 Nurse / First Aiders / Advanced Medical Post

As soon as the Emergency Management Unit is triggered, the site nurse or a designated experienced SST sets up an Advanced Medical Post (AMP).

This sheltered area allows the positioning of emergency services and facilitates their actions.

3.5 Technical specialists

Technical specialists are “business experts” who have extensive knowledge of the installations and their activities.

They have the capacity to popularize the technical explanations of the situation to the PIC and the External Rescue Manager.

They are responsible for updating the documentation relating to their activity.

3.6 Fluid specialists

“Fluids” specialists know the installations and their activities perfectly.

- They provide all available fluids to emergency services on request
- They cut off all fluid supply on demand
- They update the documentation relating to this activity

“Fluid” specialists , if present on site, master the following networks:

- electricity
- water
- hydraulic circuit
- compressed air circuit
- pressurized gas circuit
- fuel/fuel circuit

3.7 Local Incident Correspondent - LIC

The Local Incident Correspondent (LIC) is the “field” deputy of the PIC and has authority over all site personnel during emergency management.

He is trained, trained regularly and:

- can requisition any personnel and equipment
- ensures reception of emergency services
- informs the emergency services of the presence and location (if any) of storage of dangerous products
- provides emergency services with specialized personnel (Fluid specialists, electrician, machine driver, lifting team, etc.)
- distributes the different materials
- is the preferred contact for the External Rescue Manager until the arrival of the PIC

- reports to the PIC on the actions carried out on site, the position of the various " fluid " circuits , the evolution of the situation and the provision of personnel and/or equipment to the emergency services

As part of this function, the LIC is equipped with a trained back-up.

1.1. Logistics team

The establishment of a logistics team makes it possible to provide support to the rescue teams in the following context:

- Lifting (crane, etc.)
- Transport of equipment (forklift, trucks, etc.)
- Transport of personnel (train on tires, etc.)

4. CMT material resources

The equipment of the Emergency Management Unit is dedicated equipment which must, under no circumstances, be diverted for other purposes.

The means put in place must enable CMT staff to effectively carry out their missions.

4.1 Room

The CMT must be able to be implemented in a sufficiently large room. This will be sized according to the number of people making up the CMT.

These dimensions will be reassessed/optimized following the various emergency exercises and/or the ramp-up of the project.

4.2 Furniture

- table
- chairs
- cabinets
- wall clock in local time
- wall clock at Challenger headquarters time in case of time difference with the Project/site

This furniture remains permanently in the CMT room.

4.3 Office automation

- erasable magnetic whiteboards (several and very large)
- flipcharts with paper refill
- photocopier / Printer / Scanner
- Dictaphone for recording
- overhead projector
- projection screen
- power strips
- extension cords

These materials remain permanently in the CMT room, but can be used for other activities as long as their availability remains permanent for the CMT.

-
- erasable markers (minimum 4 colors) and brush

- small round magnets (several colors)
- large rectangular magnets (several colors)
- pens
- paper pads
- scotch (Building site – Large)
- stapler
- scissors

These consumables must not be used for any purpose other than for CMT.
It is essential to regularly check their presence and their state of use.

4.4 Project/Site Specific Material

- Specific office equipment
 - Magnetic representation “ Engine ” (scale allowing use on plans)
- Technical documents:
 - plan of the installations (very large model for setting up “situation”)
 - circulation plan
 - intervention plan
 - up-to-date storage plan for hazardous products (compressed gas/ petrol/ diesel/ chemicals, etc.)
 - network plan (electricity/gas/water/steam/fuel pipes, etc.)
 - accessibility plan for “ Works ”
 - technical notices
 - 3D model
 - etc.

4.5 IT and communications resources

Particular attention must be paid to the implementation and availability of the following IT and communication resources:

- landline telephone (single number)
- cell phone chargers
- Wifi internet connection (secure high speed but does not require the intervention of a network administrator to connect)
- VHF radios
 - Chargers
 - Replacement batteries
 - Dedicated channels (General / Internal services / Emergency services / CMT)
- “ Push To Talk ” phones
- RJ 45 cable (length to be confirmed depending on the site) and splitter for connecting external emergency services PCs (specific IT resources to be defined in advance with the emergency services)

4.6 Decision zone

Crisis management requires thoughtful decision-making and the PIC and the External Emergency Operations Manager must be able to communicate calmly.

An area reserved for this purpose has been set up:

- a room close to the CMT room
- a table and 2 chairs
- Rest area

A crisis situation is only over when the situation is perfectly under control and the actions taken fall within the framework of a “ normal ” resumption of activity , no longer requiring specific decisions from the Delegate of Power/Project Manager.

The duration of an emergency situation cannot therefore be anticipated and can last over time.

As a result, a rest room/area will allow staff involved in CMT to take a step back in order to reduce the level of accumulated tension.

4.7 Catering and hygiene premises

Cold and hot drinks and a catering service should enable CMT members to remain able to carry out their missions.

A dedicated room, located near the CMT room, will be identified by the Project/site.

The proximity of hygiene premises will be one of the elements to be integrated into the location of the CMT room.

4.8 Fallback site

A fallback site with the same characteristics and responsibilities as the CMT room and its annexes must be able to be activated within less than 1 hour.

5. Communications managed by the CMT

5.1 General

During an emergency situation, it is appropriate to establish controlled communication both internally and externally, in order to avoid any communication of elements that do not correspond to the reality of the facts and could harm staff and to the company.

Staff must be reminded that communication is a reserved area and that any communication outside this framework is prohibited.

5.2 Communication to emergency area

In the context of an emergency situation where personnel have taken refuge in a secure area awaiting evacuation, it is imperative to maintain very regular communication with these personnel and to keep them informed of the situation and the different actions carried out.

This communication allows:

- the CMT to keep itself informed of developments in the situation in the area concerned
- to the CMT to keep informed of the evolution of the stress level of the personnel concerned
- the personnel concerned to be informed of the actions in progress to help them

5.3 Internal communication

During the management of the emergency situation, internal communication (project/OU/country/headquarters) can be entrusted to the Human Resources Department of the project, if it has an on-site representative, trained in the principles of communication of crisis and supported by the BYTP Communication department if necessary.

Internal communication is done:

- with site personnel, in order to prevent elements such as photographs, videos, comments, etc. from being displayed. are not broadcast on social networks
- with company personnel, in order to limit guesswork and on the decision of General Management
- at a regular frequency

5.4 External communication

During emergency management (and once it is under control), external communication is of paramount importance and will impact the company's image among the general public. This communication is the responsibility of General Management and the Communication department and can be carried out in different forms:

- Press release
- press conference with or without questions
- interview by a press correspondent present near the site
- etc.

6. Demobilization of the CMT

The Emergency Management Unit ceases its activity as soon as the Project/site situation no longer generates risky situations for staff and the current activity processes are back in place.
